

ABSTRACT

A camera lens unit in a portable wireless terminal is disclosed, in which the terminal has a main body and a folder. The main body has side arms facing each other at both upper sides, and the folder has a center hinge arm with an opening at a predetermined position, hinge-combined between the side hinge arms. In the camera lens unit, a hinge dummy has an end fixed to one of the side hinge arms and is inserted from an end of the center hinge arm to an end of the opening, for rotatable engagement with the center hinge arm. A camera holder is rotatably engaged with the other end of the hinge dummy. A camera lens has an end fixed to the camera holder, is disposed in the opening, and rotates with the camera holder about a hinge axis, so that an angle of view is controlled.
